

STITZO

Trendy Tailoring — UI/UX Project Case Study

A digital tailoring experience focused on fit, customization, AI preview, and timely delivery.

Project Detail	Information
Project Type	– UI/UX — Mobile & Desktop Application
Project Name	– Stitzo
Primary Domain	– Tailoring / Fashion Technology
Role	– UI/UX Designer
Primary Tool	– Figma

1. Project Overview

Stitzo is a digital tailoring application designed to make the process of selecting, customizing, ordering, and tracking tailored outfits easier and more convenient. The concept brings several tailoring activities into one experience instead of requiring users to manage measurements, fabric choices, customization, communication, and delivery separately.

Project Goals

Create a simple, personalized tailoring journey that gives users more control and clarity from outfit discovery to delivery.

2. Problem Statement

Traditional tailoring can involve several points of friction: users may experience inaccurate fitting, difficulty finding suitable fabrics, unclear customization requirements, and delayed delivery. For busy students, managing these steps through offline interactions can be inconvenient.

Stitzo addresses these problems by bringing measurements, customization, outfit selection, tailor communication, AI preview, ordering, and tracking into a single digital experience.

3. Target User & Persona

Persona: Smirthi

Category	Details
Profile	– Busy college student / day scholar
Needs	– Easy customization, accurate measurements, fabric choices, clear delivery information
Pain Points	– Fit issues, delayed delivery, difficulty sourcing fabric, repeated communication
Expectation	– A simple, trustworthy and personalized tailoring experience

4. User Problems & Design Opportunities

User Problem

Design Opportunity

Poor or inaccurate fitting

- Save and manage body measurements digitally.

Difficulty communicating requirements

- Provide structured customization and tailor communication.

Difficulty finding fabric

- Bring selection options into the ordering experience.

Uncertainty about final appearance

- Introduce an AI-assisted preview.

Delayed or unclear delivery

- Provide order status and tracking.

Scattered tailoring activities

- Combine key services in one application.

5. Information Architecture

The application is organized around the user's main tailoring journey:

- Welcome / Login
- Home
- Categories
- Tailor Selection
- Outfit Selection
- Customization
- Measurements
- AI Preview
- Search

- AI Search / Assistance
- Chat
- Profile
- Order Tracking
- Order Confirmation

6. Main User Flow

Welcome → Login → Home → Category → Select Tailor → Select Outfit → Customize
→ next → AI Preview → Confirm Order → Track Order → Delivery

7. Key Features

Feature	Purpose
Outfit Discovery	– Browse categories and explore available styles.
Tailor Selection	– Choose a suitable tailor from available options.
Customization	– Define fabric, style and other outfit requirements.
Saved Measurements	– Store measurements to simplify future orders.
AI Preview	– Preview the selected outfit concept before finalizing.
Search & AI Search	– Find outfits and use conversational assistance to discover options.
Chat	– Communicate with the tailor when clarification is required.
Profile	– Access saved measurements, saved designs, support/help and settings.
Order Tracking	– Follow order progress.

8. UI Design System

Color Palette

Color	Hex	Use
Purple	#A878CD	Primary brand/accent color
Mint	#D8F5ED	Secondary/background/supporting accent
White / Light neutrals	—	Cards, surfaces and readability

Visual Language

- Rounded cards and controls for a friendly mobile experience.
- Purple accents to highlight actions and important states.
- Light backgrounds to keep content readable.
- Image-led presentation for fashion and outfit discovery.
- Bottom navigation for quick access to key areas.
- Consistent spacing and component styling across screens.

9. Design Process

- | | | |
|-------------------|---|---|
| Understand | – | Identify the tailoring problems faced by users. |
| Define | – | Translate problems into clear product requirements. |
| Ideate | – | Explore ways to combine tailoring services into one experience. |
| Design | – | Develop the Stitzo visual system and high-fidelity screens. |
| Prototype | – | Connect screens to demonstrate the main user journey. |
| Iterate | – | Refine the experience based on feedback and usability observations. |

10. Accessibility & Usability Considerations

- Maintain readable text sizes and sufficient contrast.
- Use icons together with labels where an icon may be ambiguous.
- Keep buttons and interactive elements large enough for comfortable touch interaction.
- Provide clear feedback after actions such as order confirmation.

11. Project Outcomes

The Stitzo concept demonstrates a complete UI/UX product workflow rather than a collection of isolated screens. It connects discovery, selection, customization, measurement, AI-assisted visualization, communication, ordering and tracking into a single product experience.

12. Future Improvements

- AR-based outfit try-on or body-aware visualization.
- More advanced AI recommendations based on occasion and preferences.
- Tailor recommendations based on location, specialization and user needs.
- Improved fabric discovery and availability information.
- Measurement guidance using camera-assisted or interactive instructions.
- More detailed delivery prediction and notifications.
- Usability testing with a larger group of target users.

13. What I Learned From the Project

- How to translate a real-world problem into a digital product concept.
- How to structure a multi-step user journey.
- How to organize a larger application using information architecture.
- How to maintain visual consistency across many screens.
- How AI features can be integrated into a user-centered product.
- How to think beyond visual design and consider the complete user experience.
